

## PLAIN LANGUAGE OVERVIEW

# How the AI-Agile agent works

You have a team of AI helpers. Each one has one job. They pass a short note to each other instead of retelling the whole story every time. And before anything moves forward, one helper's only job is to ask: *what if we're wrong?*

## THE FOUR PHASES

## Phase 1

## Figure out what to build

Before touching anything, write down what the thing is, who it's for, and what winning looks like.

*Like drawing your dream treehouse before picking up a single plank.*

## Phase 2

## Work out how to build it

Break the big idea into smaller jobs. Figure out which jobs need to happen before others. Write down the rules the builders must follow.

*Like sorting out the instruction booklet before opening the LEGO box.*

## Phase 3

## Build it, piece by piece

Pick the most important jobs. Build them. Check they work. Then pick the next batch. Testing happens alongside building — never at the end.

*Like building one room of the treehouse at a time, checking it's solid before adding the next.*

## Phase 4

## Learn and get smarter

After each build, look back at what went wrong or got confusing. Find the pattern. Update the rules so the same mistake doesn't happen twice.

*Like writing notes on your treehouse drawings so next time goes better.*

## THE RULES EVERY HELPER FOLLOWS

## Think first

Say what you're assuming. If confused, stop and ask.  
Never just guess and carry on.

## Keep it simple

Only do what was asked. Don't add extra stuff nobody asked for. If it can be shorter, make it shorter.

## Only touch your bit

Don't "fix" things you weren't asked to fix. If you see a problem outside your job, say so — don't touch it.

## Know what done looks like

Before starting, write down exactly how you'll know you're finished. Vague goals mean endless loops.

## THE MOST IMPORTANT HELPER

The challenger — every phase has one

Most helpers build things. The challenger's only job is to poke holes before anything moves forward. They don't fix. They don't improve. They ask one question:

*"What would have to be true for everything we just built to be completely wrong?"*

If the answer is scary, everything stops until a human resolves it. If it's a small risk, it gets written down and watched. Nothing sneaks through unchallenged.

## HOW HELPERS TALK TO EACH OTHER

The short note (Handoff Schema)

Instead of each helper reading the entire conversation from the beginning, the team leader hands them a short structured note with only what they need for their job. This keeps things fast and stops helpers getting confused by information that isn't relevant to them.

Capture input      Generate      ★ Challenge      Improve      Human check

Each phase runs this loop.

The challenger ★ runs in every phase — including the one that patches the rules.
